EKS Pod Identity is a credential management service that automatically fetches and rotates temporary AWS credentials for pods.

Pod Identity Association 테라폼 예시:

```
module "loki_pod_identity" {
  source  = "terraform-aws-modules/eks-pod-identity/aws"
  version = "1.10.0"

  association_defaults = {
    namespace       = "loki"
    service_account = "loki"
    tags = {
      Environment = "dev"
    }
  }

  associations = {
    dev = {
      cluster_name = module.eks.cluster_name
    }
  }
}
```

쿠버네티스 RBAC 가드레일

쿠버네티스 RBAC은 허용 정책만 지원하고 **거부 정책을 지원하지 않아 세밀한(Fine-grained) 접근 제어가 어려움**

Kyverno와 OPA가 제공하는 거부 정책을 활용하면 세밀한 접근 제어가 가능합니다.

© 2025 Younsung Lee. All rights reserved.

IAM Role에 K8s RBAC 권한을 할당할 때 사용자 이름에 `{{SessionName}}`을 포함해서 구성하면 사용자별로 접근 제어를 세밀하게 제어할 수 있습니다. Cluster Access 권장사항입니다.

실제 적용 예시

```
$ kubectl auth whoami -o yaml
```

```yaml
apiVersion: authentication.k8s.io/v1
kind: SelfSubjectReview
metadata:
  creationTimestamp: "2025-02-06T19:49:41Z"
status:
  userInfo:
    extra:
      accessKeyId:
      - ASIA1234567890EXAMPLE
      arn:
      - arn:aws:sts::123456789012:assumed-role/AWSReservedSSO_DevOps_Admin_1234abcd/john.doe@example.com
      canonicalArn:
      - arn:aws:iam::123456789012:role/AWSReservedSSO_DevOps_Admin_1234abcd
      principalId:
      - AROA1234567890EXAMPLE
      sessionName:
      - john.doe@example.com # <-- sessionName is the email address of the IAM Identity Center user by default
      sigs.k8s.io/aws-iam-authenticator/principalId:
      - AROA1234567890EXAMPLE
    groups:
    - system:masters
    - system:authenticated
    uid: aws-iam-authenticator:123456789012:AROA1234567890EXAMPLE
    username: devops-john.doe-example.com # <-- HERE
```

Kyverno 정책 설명

특정 유저의 모든 리소스에 대한 CREATE, UPDATE, DELETE 액션을 거부하는 Cluster Policy

```yaml
spec:
  background: false
  rules:
  - name: block-cluster-admin-from-ns
    match:
      any:
      - resources:
          kinds:
          - "*"
        clusterRoles:
        - cluster-admin
        subjects:
        - kind: User
          # Username is registered as cell-infra-{{SessionName}} in aws-auth configmap's mapRoles section
          name: cell-infra-elon.musk-coinone.com
    validate:
      message: "The cluster-admin 'testuser' user cannot touch testnamespace Namespace."
      deny:
        conditions:
          any:
            - key: "{{ request.operation || 'BACKGROUND' }}"
              operator: AnyIn
              value:
              - CREATE
              - UPDATE
              - DELETE
```
